KwentoHabi Title Defense — Full Q&A Cheat Sheet

Every anticipated panel question, organized by topic

Group 5 — 4-ISB | KwentoHabi, Inc. | 66 questions

Matches the final canvas: literacy as the lead problem, education-only customers, cross-author checking, an age-appropriate and teacher-controlled story space, institutional licensing as anchor revenue, Corporation structure. Jump to any section if a question comes from an unexpected angle. Figures marked as estimates are Stage 1 estimates, not quotes.

1. Problem and Evidence

Q: Is this problem real, or did your team just assume it exists?
A: It is cited, not assumed. The World Bank and UNESCO learning poverty brief estimates roughly 91% of Filipino 10-year-olds cannot read an age-appropriate text. In PISA 2022 the Philippines ranked 77th of 81 countries in reading, and DepEd itself described the gap as five to six years of lost learning.

Q: Your citations are about reading in general. Where is the evidence that writing feedback is the gap?
A: That narrowing is our reasoned inference, not something PISA or the learning poverty data measure directly, since neither tests creative writing. We believe it follows because narrative writing demands high structural and comprehension skill, and we say openly that this sub-claim is inference, not a cited fact.

Q: Why does individualized feedback matter more than general reading ability?
A: Feedback is what turns practice into improvement. A student can write constantly and not improve if nobody shows them why their story loses consistency. One teacher with 30-plus students cannot give that review to every student's long-form writing. That bottleneck is what KwentoHabi removes.

Q: How is this different from literacy reforms the government is already running?
A: DepEd's reforms address curriculum and instruction broadly. KwentoHabi targets a narrower gap inside that: structured, individualized feedback on a student's own writing, which a policy change alone cannot deliver to every student in real time.

Q: Your features talk about respect and peace, but your evidence is about literacy. Which problem are you actually solving?
A: Literacy is the lead problem, and it is the one our evidence supports. The respectful conflict resolution and the age-appropriate story space are how the product works for minors. They are a defensible design choice and a secondary contribution to peace education, not a second headline claim.

2. Product and Core Technology

Q: What does KwentoHabi do in one sentence?
A: It is an AI platform that checks Filipino students' writing against a teacher's own materials and against each other's established facts, flags where something breaks, and keeps the story space age-appropriate and teacher-controlled.

Q: What is your single biggest differentiator?
A: Cross-author continuity checking: tracking facts by author across a shared story world and flagging where one student contradicts what another established. As far as we know, Grammarly, Notion, World Anvil and Scrivener do not do this.

Q: Why can't a student just use ChatGPT?
A: A general chatbot reviews one document in one session. It has no class roster, no rubric, no memory of what a student wrote last month, and no way to reconcile facts across several students writing separately. Our moat is the persistent multi-author teaching workflow, not the AI model.

Q: Isn't AI continuity checking a solved problem?
A: Single-document checking is conceptually solvable, though not built well for classrooms. Reconciling facts established by different students across separate sessions, then feeding the result into grading and conflict resolution, is the harder and newer problem.

Q: What happens technically when a student submits writing?
A: The engine compares the new text against the applicable reference: the teacher's uploaded rubric or model text, the student's own earlier chapters, or facts already established by co-authors. It flags inconsistencies and explains the mismatch. It does not silently rewrite.

Q: Does the AI just fix the student's writing?
A: No. It flags the inconsistency and asks whether it was intentional. The student stays the author; KwentoHabi is a feedback layer, not a ghostwriter.

Q: Has this been tested, or is it only conceptual?
A: At Stage 1 it is conceptual, as the course allows. Our proof-of-concept design is two short paragraphs by two planted authors in one story world with one deliberate contradiction, fed to an LLM prompted to extract and cross-check facts per author. That small test would validate the core mechanic.

Q: Why the name KwentoHabi?
A: Kwento means story and habi means to weave. It describes the product, weaving many students' stories into one consistent world, and signals a Filipino-first focus. The group is still confirming the name and checking that it is available.

3. Cross-Author Continuity Checking

Q: Walk me through how cross-author checking works.
A: As students write in a shared story space, KwentoHabi tracks facts by author: who established what, and when. If one chapter contradicts a co-author's earlier fact, both students see the two lines side by side with author and timestamp, and the teacher sees a class-level map of contested facts.

Q: Why is group writing hard to grade fairly today?
A: Teachers have no easy way to see who contributed what, or whether a group coordinated or one student carried the work. Cross-author tracking and the weekly contribution record make individual contribution visible for the first time.

Q: What if two students deliberately want conflicting versions, like an unreliable narrator?
A: The system flags the contradiction and offers a choice, including keeping both as an intentional difference in perspective. A deliberate narrative decision is recorded as a decision, not treated as an error.

Q: Isn't this just version history, like Google Docs?
A: Version history shows what changed. It does not understand meaning, so it would not know a character's eye color contradicts something another student wrote three chapters earlier. KwentoHabi reconciles facts semantically, by author.

4. Safe, Respectful Story Space

Q: Are you claiming KwentoHabi prevents violence?
A: No. No evidence supports that and we do not claim it. Our claim is narrower: students get repeated, structured classroom practice at disagreeing respectfully, resolving conflict and being accountable, which are skills values and peace education aim to build, inside a writing space designed to be age-appropriate.

Q: Isn't banning violent content impossible, and censorship? Noli Me Tangere has violence.
A: We do not ban violence. Our wording is age-appropriate and teacher-controlled. The teacher sets a content level, with a strict default for junior high, and can loosen it for literature study. The AI flags; the teacher decides.

Q: How does content screening work?
A: The AI screens for graphic violence, self-harm, sexual content and hate. A flagged passage is not auto-deleted. It goes to the teacher, and the student sees a friendly prompt to rework it or ask their teacher.

Q: What if the filter is wrong, over-flagging or missing something?
A: Filters do err, which is why a teacher stays in the loop and flags are suggestions, not verdicts. Teachers can override, and we would track false flags to tune the prompts. KwentoHabi supports teacher supervision; it does not replace it.

Q: What if a student writes something that suggests they are in distress?
A: It is routed to the teacher or guidance counselor. The AI does not diagnose, label or punish the student. A human decides what to do. We are a writing tool, not a mental health service, and we say so.

Q: How does the Respect feature work?
A: When a contradiction is found, each student writes a short Perspective Note, with AI sentence starters, acknowledging the classmate's version before explaining their own. Only that story thread pauses, not the whole project.

Q: How does Peacemaking work?
A: After the notes, students choose a Resolution: merge the versions, keep both as an intentional difference in perspective, or ask the teacher. The teacher dashboard logs how each group resolved it.

Q: What does Discipline mean here?
A: Contribution deadlines and a weekly record of who contributed what. Any streak feature is optional, teacher-controlled and group-level, so no individual student is shamed or pitted against classmates.

Q: How do you protect minors' data and privacy?
A: Accounts are school-scoped, with a guardian consent notice, and data collected is kept minimal. The Data Privacy Act of 2012 (RA 10173) applies, so we would work with schools' data protection officers. Detailed compliance is future work; cybersecurity is a listed cost.

Q: Does this relate to the Anti-Bullying Act or DepEd child protection policy?
A: We do not claim to detect or prevent bullying. We give teachers visibility into conflict in group work, which can support a school's own anti-bullying and child protection practices. We would confirm the exact requirements with schools before making any compliance claim.

Q: Why not an open public community where anyone can read and comment?
A: Our primary customers are minors, so accounts are school-scoped. An open public feed would conflict with the safe-space promise, which is also why open indie-author features are not in this version.

Q: What does moderation cost?
A: It is a listed cost: a content-moderation API plus teacher-review support. We expect it to be small next to AI continuity-checking cost, but we have not priced it yet.

5. Materials Archive and Upload Rights

Q: What is the shared archive, and how is it different from a folder of files?
A: Each item is a reference standard, not just a file. An uploaded rubric maps feedback categories to its criteria; an uploaded model narrative has its structure extracted and used to benchmark student drafts.

Q: Isn't this just DepEd's Learning Resource Portal?
A: The LR Portal stores materials for people to read. KwentoHabi parses uploads into structured standards that the feedback engine actively checks student work against. The archive is an input to an active system, not a passive repository.

Q: How do you handle copyright on uploads?
A: Every upload needs an attestation that the uploader wrote it, has permission, or that it is public domain or openly licensed. Uploads default to private and school-scoped, and go through a light review gate only if the uploader chooses to share them.

Q: What if someone uploads material they do not have rights to?
A: Flagged items are pulled from public view pending review, and our terms place responsibility for false attestation on the uploader, not the platform.

Q: How do you fill the archive before anyone uses the platform?
A: A cold-start plan: openly licensed and public-domain texts, DepEd-released exemplars where licensing permits, and materials from one pilot school in exchange for a free first year.

6. Business Model and Revenue

Q: What is your primary revenue model?
A: Institutional and classroom licensing to schools and universities is the anchor: a steadier B2B line. Marketplace fees on teacher-contributed materials and CSR support for public schools are secondary.

Q: Who actually pays: students, parents or schools?
A: Schools and universities. Students use the product through a school license, so families are not asked to pay in the core model.

Q: What are the marketplace fees charged on?
A: Teacher-contributed materials shared through the archive. A fee applies when other users access them. We have not set the fee level; that is later-stage pricing work.

Q: What is CSR support?
A: Corporate social responsibility funding, for example a company sponsoring licenses for public schools that cannot afford them. It is a secondary stream and an access tool, not something we rely on alone.

Q: Do your unit economics work?
A: At an estimated $0.02 to $0.05 per check and about 20 checks per student per month, AI cost is roughly $0.40 to $1.00 per student per month, below a projected ₱50 to ₱100 per-student fee. These are Stage 1 estimates, and we would state the exchange rate assumed since one side is dollars and the other pesos.

Q: Can a public school in a poor area afford a per-student fee?
A: That is why free archive access and CSR-sponsored licenses exist. The fee is a projection, not a quote, and the funding source for each school would be worked out in pilots.

Q: School procurement takes 6 to 12 months. How do you survive?
A: Honestly, our non-license income is small, so we plan to keep costs lean on pay-as-you-go cloud and AI usage, run a pilot school on a free first year, build adoption through free archive access, and add marketplace fees and CSR support. This is the real risk of the model, and we name it.

Q: Why give away archive access if licensing is your anchor?
A: It is the acquisition channel, not a competing business. It keeps KwentoHabi embedded in classrooms by the time a purchase decision arrives.

Q: What is your biggest cost risk?
A: AI API cost scaling with usage. Because revenue is a per-seat license, cost is predictable, and capping checks per student per month is one control. It is still our largest variable cost.

7. Business Organization (Corporation)

Q: Why is KwentoHabi a Corporation?
A: With six co-founders, a stock Corporation allows shared ownership through shares and limits each founder's personal liability to their investment. That matters because the platform handles student data, and schools expect a formally registered entity before signing a license.

Q: Why not a Sole Proprietorship?
A: It allows only one owner with unlimited personal liability. We have six founders and a platform that holds sensitive data.

Q: Why not a Partnership?
A: General partners can be personally and jointly liable for business debts. With institutional contracts that is a risk we chose to avoid.

Q: Why not a One Person Corporation?
A: An OPC requires exactly one stockholder. We have six, so a regular stock Corporation under the Revised Corporation Code (RA 11232), which allows 2 to 15 incorporators, fits.

Q: Isn't an LLC simpler?
A: LLC is a U.S. designation, not a Philippine business structure. The real options are Sole Proprietorship, Partnership, Corporation and One Person Corporation, and Corporation matches our team size and liability needs.

Q: How is ownership split among the six?
A: Through shares of stock, divided by agreed contribution, role or investment, so each founder has a documented stake rather than an informal understanding.

8. Market and Competition

Q: How is this different from Grammarly, Notion, World Anvil or Scrivener?
A: None gives story-level structural feedback, and none track facts across several authors in one shared document. Grammarly works at the sentence level; the others are organizational tools without a feedback loop.

Q: What stops a bigger EdTech company from copying this?
A: They could add an archive feature quickly. What they cannot quickly replicate is a materials library parsed against local curricula and contributed by teachers already using the tool, plus a term of longitudinal cross-author data from real classrooms.

Q: Why the Philippines first?
A: The value proposition maps onto a documented local gap, and there is a real writing culture: Wattpad reported about 7 million monthly users in the Philippines in 2019 (Adobo Magazine). We would not claim a global ranking we cannot source.

Q: Who are your realistic competitors?
A: There is no direct feature-for-feature competitor for cross-author continuity checking that we know of. Indirect competitors are organizational tools like Notion and World Anvil, general AI writing assistants, and generic learning platforms.

Q: Earlier versions included indie authors, comics and freemium. Why remove them?
A: To keep the concept focused and buildable. Indie authors are an open, mostly adult audience, which conflicts with a safe space for minors, and comics were hard to sustain. The same engine could serve other users later, but it is not our launch segment.

9. Sustainability and Risk

Q: Is the model sustainable long term?
A: Institutional licensing gives a predictable base, and per-student AI cost is small against the projected fee. The honest weak spot is concentration on school deals, which is why we plan lean costs, pilots and CSR support.

Q: What is your biggest weakness right now?
A: Selling to schools is slow, and curriculum alignment needs ongoing investment. A second weakness is that the safe-space filter will not be perfect, which is why teachers stay in control.

Q: What if a school's deal falls through?
A: Free archive access keeps the platform in that classroom if the deal is only delayed. If it is dead, we depend on other schools, CSR support and lean costs, because we no longer have an independent consumer revenue line. We accept that tradeoff for focus.

Q: What is your path to profitability?
A: This is a Stage 1 concept. CAC, LTV, break-even and specific price points are later-stage work after the core product and first school partnerships are validated.

Q: What if AI costs rise or the AI provider changes terms?
A: Per-student cost is a small share of the projected fee, so there is room to absorb increases, and we can cap checks per student or switch providers. Depending on an outside provider is a real dependency.

10. SDG and Social Impact

Q: Which SDGs does KwentoHabi align with?
A: SDG 4, Quality Education, is primary, including target 4.7, which covers education for a culture of peace and non-violence. SDG 16, Peace, Justice and Strong Institutions, is secondary through classroom practice in peaceful conflict resolution. SDG 9 reflects the AI reconciliation engine as new infrastructure, and SDG 10 reflects shared materials and CSR-sponsored licenses helping under-resourced schools.

Q: Isn't SDG 16 a stretch?
A: It is explicitly secondary. We claim practice in peaceful conflict resolution at classroom scale, not a reduction in national violence.

Q: Earlier versions listed SDG 8. Why is it gone?
A: It rested on the indie creator economy, which is no longer part of the launch model. We would rather claim fewer SDGs that the model actually supports.

11. Stage 1 Framing and Process

Q: Is this a fully validated, ready-to-launch business?
A: No, and it is not meant to be. Stage 1 asks for a defensible starting concept, not a completed Business Plan. Validation, testing and refinement are the work of later stages.

Q: Why should we approve this if so much is unproven?
A: The problem is cited and real, the technology is a differentiated response, the business organization is correctly anchored, and all nine blocks are consistent. That is a concept with enough potential to be developed, tested, challenged and improved.

Q: What would you do between now and the next stage?
A: Run the cross-author proof-of-concept, interview a handful of teachers about the feedback gap and the safe-space controls, and refine unit economics.

Q: What is the single thing you would most like to prove first?
A: That the AI can reliably catch real contradictions between two authors without too many false flags, because teacher trust depends on it.
